Fire Protection Pressure Reducing Valve

Description

The Cla-Val Model 90-21 Pressure Reducing Valve automatically reduces a higher inlet pressure to a steady lower downstream pressure regardless of changing flow rate and/or varying inlet pressure. This valve is an accurate, pilot-operated regulator capable of holding downstream pressure to a pre-determined limit. When downstream pressure exceeds the pressure setting of the control pilot, the main valve and pilot valve close drip-tight.

If a check feature is added, and a pressure reversal occurs, the downstream pressure is admitted into the main valve cover chamber, which closes the valve to prevent return flow.

Main Valve Features

- Dual Guided Stem Internal for Reliable Seating
- Tapered Metal Seat for Drip Tight Shut-off
- Replaceable 316 Stainless Steel Seat
- Single Internal Guided Assembly
- Proven Repeat Functionality in Harsh Conditions
- In-Line Maintenance

P	Gauge Option

The Cla-Val Model 90-21 Pressure Reducing Valve pilot control system is very sensitive to slight downstream pressure fluctuations and will automatically modulate to maintain the desired pressure setting. The CRD (Item 3) pilot can be easily field adjusted to a wide range of pressure settings. While monitoring the system's downstream pressure gauge (P2), the CRD adjustment screw can be turned clockwise to INCREASE pressure or counterclockwise to DECREASE pressure. The CRD adjustment screw is protected by a screw-on cover, which can be sealed to discourage tampering.

System Parameters

- Underwriters Laboratories requires the installation of pressure gauges upstream and downstream of Pressure Reducing Valves.
- A relief valve of not less than 1/2 inch in size must be installed on the downstream side of pressure reducing valves. Adequate drainage for the relief valve discharge must be provided.
- The 90-21 may be installed in either vertical or horizontal positions.
